

*As a final reflection, write about 2 different Azure cognitive resources-specific problems you encountered during this project and how you resolved them. Submit your write-up in a PDF or Text document.*

One of the problems encountered while using the Azure cognitive service is validation of resources when they are created. I resolved it by changing the resource name every time the error came up.

The other problem I encountered is the azure portal was not able to access my blob storage. I resolved it by filling in \* under the allowed origin column instead of specifying a particular URL.
